

## Warm Up

Evaluate each definite integral.

1.  $\int_{-5}^1 -|x^2 + 4x| dx$

$$= \int_{-5}^{-4} -(-x^2 - 4x) dx + \int_{-4}^0 -(-x^2 - 4x) dx + \int_0^1 -(x^2 + 4x) dx$$

$$= \left[ \frac{1}{3}x^3 + 2x^2 \right]_{-5}^{-4} + \left[ \frac{1}{3}x^3 + 2x^2 \right]_{-4}^0 + \left[ -\frac{1}{3}x^3 - 2x^2 \right]_0^1$$

$$= \left( \frac{64}{3} + 32 \right) - \left( \frac{125}{3} + 20 \right) + \left( \frac{64}{3} + 32 \right) - \left( \frac{64}{3} + 32 \right) - \left( -\frac{1}{3} - 2 \right)$$

$$= \frac{64}{3} + 32 - \frac{125}{3} - 20 + \frac{64}{3} + 32 - \frac{64}{3} - 32 + \frac{1}{3} + 2$$

$$= \frac{64 - 125 + 64 - 64 + 1}{3} + 32 - 20 - 32 + 2 = \frac{-59}{3} + 2 = -\frac{55}{3}$$

2. Ex:  $f(x) = \begin{cases} \frac{x}{2} - 1, & x \leq 2 \\ x^2 - 6x + 8, & x > 2 \end{cases}$  Find:  $\int_0^3 f(x) dx$

$$= \int_0^2 \left( \frac{x}{2} - 1 \right) dx + \int_2^3 (x^2 - 6x + 8) dx$$

$$= \left[ \frac{1}{4}x^2 - x \right]_0^2 + \left[ \frac{1}{3}x^3 - 3x^2 + 8x \right]_2^3$$

$$= \left( \frac{1}{4}(4) - 2 \right) - 0 + \left( \frac{1}{3}(27) - 3(9) + 8(3) \right) - \left( \frac{1}{3}(8) - 3(4) + 8(2) \right)$$

$$= (1 - 2) + (9 - 27 + 24) - \left( \frac{8}{3} - 12 + 16 \right)$$

$$= -1 + 6 - \left( \frac{8}{3} + 4 \right) = 5 - \frac{20}{3} = \frac{15 - 20}{3} = -\frac{5}{3}$$

3. A car travelling at 75 miles per hour is brought to a stop, at a constant deceleration, 150 feet from where the brakes are applied.

$75 \text{ mph} = 110 \text{ ft/sec}$

a. How far has the car moved when its speed has been reduced to 40 mph?

$40 \text{ mph} = 58 \frac{2}{3} \text{ ft/sec}$

$$a(t) = -K$$

$$v(t) = -Kt + 110$$

$$s(t) = -\frac{1}{2}Kt^2 + 110t \quad s_0 = 0$$

$$v(t) = 0 \text{ after car moves 150 ft.}$$

$$0 = -Kt + 110 \quad \boxed{t = 110/K}$$

$$a(t) = -40 \frac{1}{3}$$

$$v(t) = -40 \frac{1}{3}t + 110 \quad 150 = -\frac{1}{2} \left( \frac{110}{K} \right)^2 \cdot K + 110 \left( \frac{110}{K} \right)$$

$$58 \frac{2}{3} = -40 \frac{1}{3}t + 110 \quad K = 40 \frac{1}{3}$$

$$t = 14 \frac{1}{11} \quad s(14 \frac{1}{11}) = \frac{-121}{6}t^2 + 110t = 107 \frac{1}{3} \text{ feet}$$
